10,100.00% APY | 11% Buy Tax | Daily ROI: 1.28%
22% Sell Tax | Daily Sell Limit: 1-5%

Overview

\$ARB is a state-of-the-art auto-staking, auto-compounding DeFi 3.0 project on the Binance Smart Chain that offers holders a daily ROI (Return On Investment) of 1.28%. Afterburner holders receive an annual compound interest of 10,100.00%, with rebase payouts every 15 minutes and tokens automatically compounded each epoch (rebase period). With the help of an Anti-Dump mechanism, Afterburner aims to minimize the impact of pumps and dumps on the \$ARB market, ultimately preventing sharp crashes and protecting the platform from volatile market scenarios.

Sustainability, stability, and long-term investment form the foundation for our vision. Sustainability will be ensured by buybacks, burns, and taxes collected from transactions, i.e., 11% from buys and transfers and 22% from sales, while stability will be ensured by Afterburner's Anti-Dump mechanism. This potent combination will enable Afterburner to attract new investors continuously, creating an ever-soaring market cap.

Afterburner Engine

The Afterburner engine is a gamified smart contract mechanism that incentivizes investors to make purchases in 10-minute intervals, consequently generating new cash flow for the protocol. 3% of buys/transfers and 10% of sells will be compiled into the reward pot for two possible outcomes: combusting or winning.

A 10-minute timer resets whenever a minimum 0.1 BNB value purchase is made. Combustion occurs when the reward pot reaches USD 10,000 without anyone winning, after which the afterburner engine will send 50% of the collected funds to the burning chamber. The remaining 50% will be passed on to the next round. If no investments worth at least 0.1 BNB are made within 10 minutes after the last purchase, the last buyer wins.

When this occurs, half the pot is carried over to the next round, 25% is sent to the burning chamber, and the remaining 25% is given to the winner. Regardless of the outcome, both the platform and the investors benefit from the Afterburner Engine.

Anti-Dump Mechanism

DeFi projects are known to be particularly vulnerable to sharp rises and crashes, with traders capitalizing on long-term investors' liquidity. This is a significant problem on the DeFi platform. To resolve this, the ADM limits the token withdrawal amount to a rate of 1-5% per day, which could be increased through community effort. With this mechanism, holders are protected from bulk sell-offs that can cause the \$ARB value to crash. Thus, these limitations benefit both parties by creating a consistent investment platform.

Autonomous Liquidity Engine

Market liquidity is essential to the health of a protocol. So every 24 hours, the market will be injected with liquidity via the autonomous liquidity engine. The Auto-LP wallet is automatically funded with 4% buy/transfer and 4% sell fees. In addition, the Auto-Liquidity Engine's AMM algorithm adds accumulated BNB and token holdings as extra liquidity in a 50/50 split, further increasing liquidity. This addition is done every 24 hours to protect holders from volatility by strengthening the market structure, lowering slippage, and extending the Afterburner runway. 4% of the tax from each buy/transfer and sell is automatically stored on the Auto-LP wallet in the form of \$ARB tokens.
